VS Code Events

- Toolbar and Console trigger vscode.debug.onDidChangeActiveDebugSession
 Which in turn triggers vscode.debug.onDidChangeActiveStackItem
 This event is also raised by the stack view and gives debug/core/stack/thread change
 event
- -- When the context is changed, the stack view selects the first available element for that context, skipping "de-emphasised" elements
- + There are also session start/stop events to allow tracking active sessions per window if required
- -- Conclusion: this is enough to keep debug context in sync across extensions without separate control extension
- -- Caveat: it doesn't seem possible to control the debug context with a custom view, so we need to use one of the existing controls.

Single vs Multiple Windows

-- VS Code panels are singular

- Variables and watch update based on the context selected
- Breakpoints & disassembly are tied to source windows
- Debug console is special it has a dropdown which changes the whole context

-- CDT Cloud views are under our control

- Peripheral panel this needs to updated based on context selection needs checking
- Memory window this is per debug session needs controls/session label

Proposals

-- VS Code

- Short term
 - Look into disassembly view and how it links to the rest of the system Should this be tied to source as it is today?
 - Propose multiple disassembly views can be opened and linked to debug contexts
- Long term
 - Propose to VS Code that multiple panels (e.g. variables) can be opened

+ CDT Cloud

- Short term
 - Peripheral panel (and registers panel): check/make it work like existing VS Code panels (single panel which switches on context)
 - Memory Inspector: Add debug context drop down to view and set/pin this per window
- Long term
 - Peripheral panel: allow multiple to be opened with debug context dropdown for setting/pinning
